It refers to the Spanish stew, but also keep your eyes open for clues that refer to mishmash, variety or collection, mixed bags, spicy stews, or this bit and that. Can't get enough of a complicated word puzzle? These 15 will leave you stuck. Answer: OLIO Originally Published: August 12, 2019 One of linux determinant features and operating systems like other UNIX is that everything is file. This is oversimplification, but understanding what it means will help you understand how Linux works. Many things on Linux appear in your file system, but they're actually not files. They are special files representing hardware devices, system information and other things — including random number generators. These special files may be located in pseudo or virtual file systems such as /dev, which contain special files representing the device, and/proc, which contain special files that represent the system and process information. /proc For example, let's say you want to find information about your CPU. Directory / proc contains special files - / proc/cpuinfo — which contains this information. You don't need a special command that tells you your CPU information — you can only read the contents of this file using any command that works with plain text files. For example, you can use the command cat / proc / cpuinfo to print the contents of this file to the terminal - print your CPU information to the terminal. Terminal. can also open/proc/cpuinfo in the text editor to view its contents. Remember, /proc/cpuinfo isn't actually a text file that contains this information - the Linux volume and the proc file system disclose this information to us as a file. This allows us to use common tools to view and work with information. The directory/proc also contains other similar files, for example: /proc/uptime — Reveal your Linux kernel uptime — in other words, how long your system has been turned on without closing. / proc/version - Reveal your version of the Linux kernel. /dev In the directory /dev, you will find files representing the device — as well as files that represent other special things. For example, /dev/cdrom is your CD-ROM drive. / dev/sda represents your first hard drive, while / dev/sda1 represents the first partition on your first hard drive. Want to launch your CD-ROM? Run the mountain command and specify /dev/cdrom as the device you want to mountain. Want your first hard drive partition? Run the disk separation utility and specify /dev/sda as the hard drive you want to edit. Want to format the first partition on your first hard drive? Run formatting instructions and tell it for format/dev/sda1. As you can see, revealing this device as part of a file system has its advantages. The file system provides consistent namespace that all applications can use to handle and access devices. /dev/cancel, /dev/random, and /dev/zero File system/dev does not only contain files representing physical devices. Here are three of the most notable special devices it contains: /dev/null — throw away all the data written to it - think of it as a litter can or a black hole. If you've ever seen a comment telling you to post complaining to /dev/null — that's how geeky says throw it in the trash. /dev/random - Produces random use of environmental noise. It's a random number generator that you can tap. /dev/zero - Produce zero - zero continuous flow. If you think of these three as files, you won't see usage for them. Instead, think of them as a tool. For example, by default, Linux commands generate error messages and other outputs they print to standard output, usually terminals. If you want to run an order and don't care about its output, you can direct that output to /dev/null. Directs the output of the command to /dev/cancel immediately remove it. Instead of having each command execute your own quiet mode, you can use this method by any order. instructions > /dev/null If you want a random source — say, to generate encryption keys, you don't have to write your own random number generator - you can use /dev/random. To erase Hard drive by writing 0's to it, you don't need a special utility dedicated to zero drive - you can use a standard utility and/dev/zero. For example, the dd command sounds from a location and writes to another location. The following commands will read zero from / dev/zero and and they proceed to the first hard drive partition on your system, completely erasing its contents. (Warning: This command will erase all data on your first compartment if you run it. Just run this command if you want to destroy the data.) dd if=/dev/zero of=/dev/sda1 Here we use dd with special files (/dev/zero and/dev/sda1), but we can also use dd to read and write to real files. The same command works to manipulate the device directly and work with files. Explanation In practice, it's more accurate to say that everything is a byte flow than everything is file. / dev/random is not a file, but it is definitely a bytes flow. And, although these things are technically not files, they are accessible in file systems - the file system is a universal name space where everything is accessible. Want to access a random number generator or read directly from the device? You'll find both in the file system; no other form of address required. Of course, some things aren't actually files — the processes that run on your system aren't part of the file system. Everything is a file is inaccurate, but many things behave as files. File.
